Semicolon Expected Sprint 2 Reflection

I accomplished displaying playlists for the user after they login in and creating two mockups. The playlist display shows the songs on the playlist that the user has open. The two mockups are for the login page and playlist page. Currently the playlist just has the text and the mockup of the playlist is meant to act as a guide for me to reformat it to be more visually appealing. Challenges that I personally encountered were with VScode and the updated app.py. I am still new to VS code so I was experiencing some issues with using it effectively which took some time to figure out. The app.py was also updated to require an env file which I was not aware of initially. So, I spent some time trying to resolve the issue before Angel mentioned the env file and after that I found out that I needed a Spotify account and need to send the email associated to Angel before I could test the code more properly. So, I had Angel confirm for me that the playlist code worked in the meantime. Other than technical issues my biggest issue has been trying to find time in my schedule to work on the project more often. I have five classes with many important assignments being due in the week including multiple programming assignments. I have been trying to deal with this as best I can.

I learned that some app.pys need env files. The tutorial I watched did not mention them so I did not know that they would be necessary for any app.pys. I have learned how to make buttons in html because I have been working on some code for them which I have not committed them yet. I have not included them in the accomplishments because they are not committed and I started on them this week which I believe counts as sprint 3.

As for what I can improve on with my work similar to last time I need to find good times to work on the project more often. Very importantly I think I need to communicate better. I would have resolved the VScode issue sooner if I found out that it requires an env file sooner. Though, I think the time aspect is very important as well since it has been an ongoing issue for me. I think better communication could help the whole team though since Aidan did run into the same issue as I did with the env file. Also I ended up working on another py file and html that were deleted because there was some confusion with which parts I was handling. So these two are the main issues.
