## Sprint 2 Reflection

This sprint I didn't get to do as much work as I would've hoped for. I mostly spent time building a tentative homepage for our website. This included the title of our software, a login button that takes you to log in to Spotify, and a description of our software. I also spent some time trying to make the design of our website aesthetic and fitting, as I view that to be an important element of any software. I've never used Python or done any website building so time was usefully spent learning new ways of coding.

I encountered some technical challenges that revolved around learning how to use things like Flask, which is the framework we use to build our website. These issues were all resolved fairly easily with some googling and asking for help from teammates.

As I've described, I learned a lot about the tools we are using to build our software, like the Spotify API, flask, and even using things like CSS and HTML. I would also like to add that I think our group has been doing a much better job of communicating and getting things done. We've begun using ClickUp more and started committing more to our GitLab.

I still think I need to improve on everything I've mentioned so far in this reflection, especially communication. I also said previously that I didn't get as much work done as I was hoping to get done, and that had a large part to do with my planning. Other aspects of my life distracted me from my goals with this project to a large degree and I can only blame myself for allowing that, as the main issue was I didn't allow enough time to sufficiently work on our software. I've started planning better for Sprint 3 so I don't become as disorganized and make sufficient room for my work.
